REPARATIVE MEDIA: HOW TO HEAL OUR CULTURE

Reparative Media argues we can create a healing cultural system by developing media, technology and research in communities and informed by intersectionality. I base my argument on five years of deep, productive, and complex work creating an independent alternative to networked media platforms like Netflix: a Chicago-based channel called OTV | Open Television developed in solidarity with Black and Brown queer, trans and women-identified artists—professional cultural healers. I use OTV as a case study for broader systemic changes that are clear and concrete, if only we can commit as much to repairing systems as we do ourselves. Like all processes for healing great wounds, reparative research & development (R&D) is not simple, easy or perfect, but its effects are immediate and backed by data. Reparative Media takes us from Black activist spaces on Chicago’s segregated South Side to the Emmys in Hollywood and tech campuses in New York, revealing how the small, local and intersectional has tremendous reparative power in the global, digital age.
